EXPERIMENT 7: ZOHO CREATOR API INTEGRATION

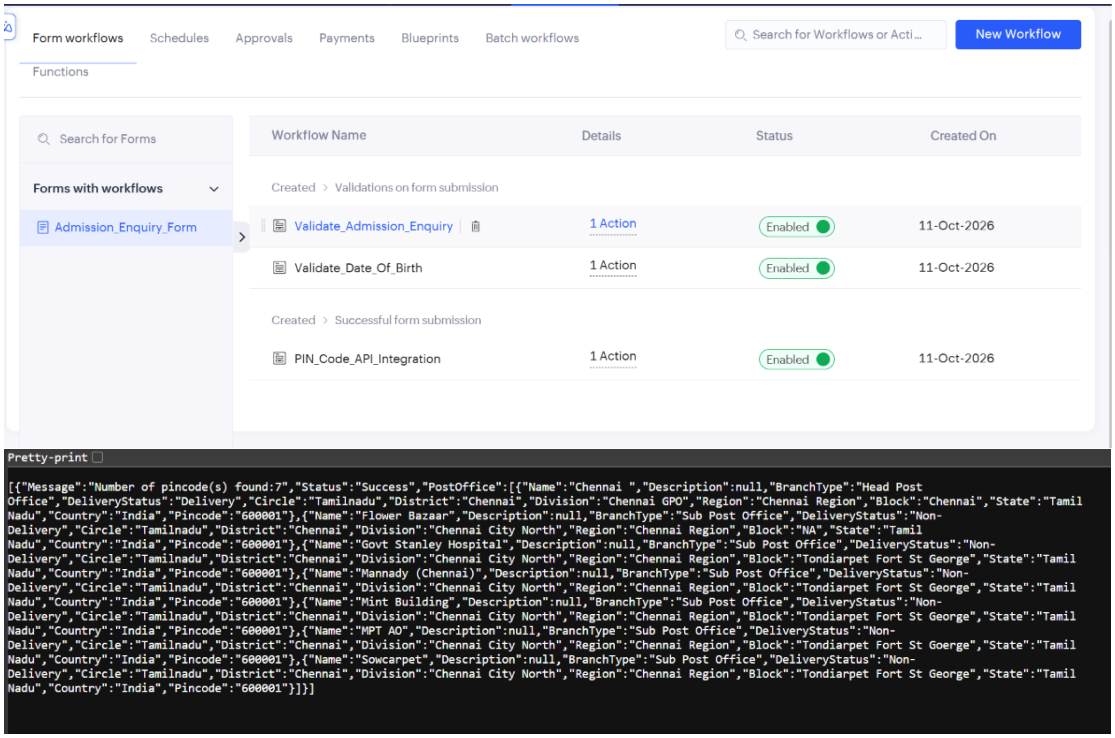

Aim

To integrate an external REST API with Zoho Creator using Deluge scripting to retrieve postal code information and demonstrate communication between Zoho Creator and an external service.

Procedure

1. Log in to Zoho Creator and open the **Student Admission Enquiry Management** application.
2. Open the existing Admission_Enquiry_Form in the form editor.
3. Add three fields: **PIN Code, District, and State**, if they do not already exist.
4. Configure the field link names for the three fields.
5. Open the **Workflows** section and create a new workflow named PIN_Code_API_Integration.
6. Configure the workflow to execute when the admission enquiry form is submitted.
7. Add a Deluge script action to the workflow.
8. Use the invokeurl task to send a GET request to the Indian Postal PIN Code API.
9. Retrieve the API response and extract the District and State information.
10. Assign the retrieved values to the corresponding District and State fields, using their correct field link names.
11. Save the Deluge script and workflow after resolving any errors.
12. Open the application and submit a test admission enquiry with a valid PIN code, such as 600001.
13. Verify the API integration by checking whether the correct postal information is retrieved and stored.

SCREENSHOT:

Result

Thus, an external REST API was integrated with Zoho Creator using Deluge scripting. The integration demonstrates how external postal code information can be retrieved and used in the Student Admission Enquiry Management application.
