EXPERIMENT 11: APPLICATION DEPLOYMENT AND MIGRATION

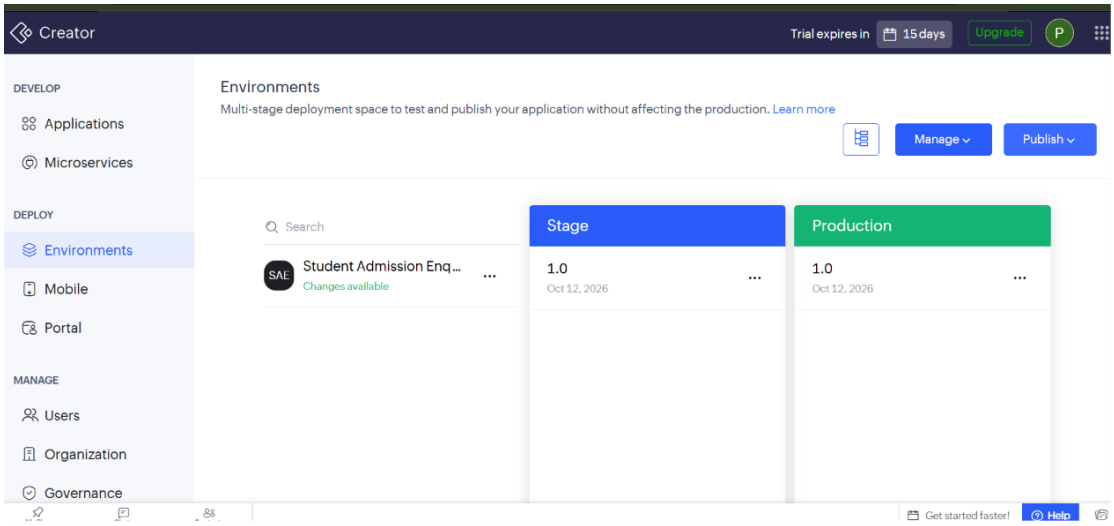

Aim

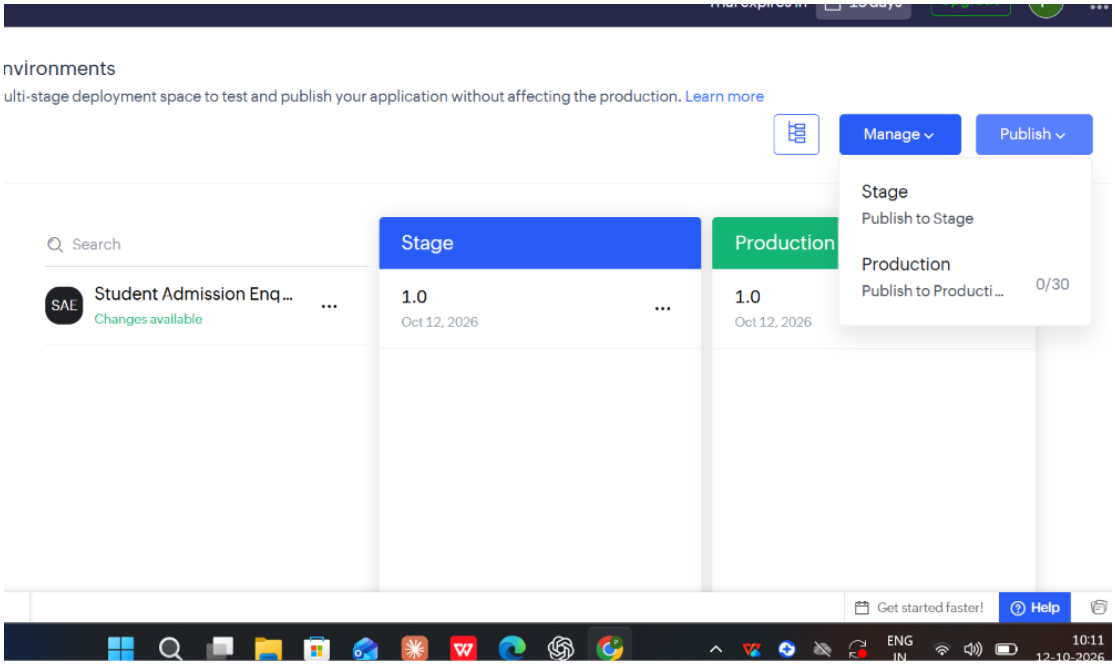

To understand and perform application deployment and migration in Zoho Creator by preparing the Student Admission Enquiry Management application for deployment, verifying its components, and exploring application export and migration procedures.

Procedure

1. Log in to Zoho Creator and open the existing **Student Admission Enquiry Management** application.
2. Open the application editor and inspect the available deployment and environment settings.
3. Verify the admission form, reports, workflows, user permissions, and analytics dashboard before deployment.
4. Test the Admission_Enquiry_Form by submitting a sample admission enquiry and checking whether the record appears in the corresponding report.
5. Verify that the reports and dashboard open correctly.
6. Open the **Settings** section and look for the available application export or backup options.
7. If an export option is available, export the application definition or application package according to the available settings.
8. Review the migration options and identify the steps required to move the application to another environment or account.
9. Check the application components and their dependencies before migration, including forms, reports, workflows, permissions, and external integrations.
10. If supported by the account, import the application package into a test environment and verify the migrated components.
11. Test the application after deployment or migration to confirm that the forms, reports, and configured workflows function correctly.
12. Document the deployment or migration process using screenshots of the configuration and verification steps.

SCREENSHOT:

Result

Thus, the application deployment and migration process in Zoho Creator was studied using the Student Admission Enquiry Management application. The application components were reviewed, and the available procedures for application export, deployment, and migration were explored.
